

DEHUMIDIFIERS

. . . for the prevention of excessive humidity

If the humidity increases regularly over 60% relative humidity, this not only compromises our wellbeing but also causes considerable damage to buildings, furniture or warehouse goods. Mould, decay, corrosion and unpleasant odours can arise. In electric plants excessive humidity can even lead to the breakdown of important systems.

To counteract these problems, we can also offer various solutions in this area of air-conditioning technology.

Standard models:

- DRYROOM* SERIES for room air dehumidification
- DRYTEX* SERIES for the quick drying of textiles (coming soon)

Special models:

It is precisely for the dehumidification of electric switch cabinets and electronic housings that special units are in demand with minimum dimensions. We design and build these according to your specific requirements.
