

AIR/WATER HEAT EXCHANGERS

. . . for the air-conditioning of switch cabinets and housings

If there is already a cold water network for an industrial process or a liquid cooler is being used the electric switch cabinet can also be air-conditioned using an air/water heat exchanger switched in-between. Instead of active air-conditioning equipment this solution is often easier, operationally safer and cheaper.

There are two different series of standard units available which can be adapted to customised special requirements.

Both standard ranges:

- LWT** SERIES for vertical attachment
- LWS** SERIES for horizontal installation in the switch cabinet base

Die Sondermodelle:

Oft Often because of special room considerations in the housing to be air-conditioned no standard unit can be used. In this case, we design and manufacture a special model in line with your special requirements.
